Management of Headache Following Concussion/Mild Traumatic Brain Injury

Defense and Veterans Brain Injury Center
Released February 23, 2016
Clinical Recommendation

Learning Objectives

- Describe the occurrence of post-traumatic headache (PTH) following a concussion
- Distinguish between the common PTH types
- Apply methods to assess, diagnose and manage common PTH types
- Understand non-pharmacologic and pharmacologic treatments
- Use treatment guidelines for PTH in deployed and non-deployed settings
Defense Department TBI Statistics

DoD Numbers for Traumatic Brain Injury Worldwide – Totals

2000-2015 Q1-Q3

- Penetrating: 4,944
- Severe: 3,502
- Moderate: 28,701
- Mild: 279,898
- Not Classifiable: 22,417

Total - All Severities: 339,462

Source: Defense Medical Surveillance System (DMSS), Theater Medical Data Store (TMDS) provided by the Armed Forces Health Surveillance Center (AFHSC)

Prepared by the Defense and Veterans Brain Injury Center (DVBIC)

*Percentages do not add up to 100% due to rounding

2000-2015 Q1-Q3, as of Dec 08, 2015

"Medically Ready Force...Ready Medical Force"
Purpose and Scope of Clinical Recommendation

- Headache is the most common symptom reported following a concussion
- 74% of an OEF/OIF cohort reported PTH that occurred within 30 days of sustaining a concussion
- These recommendations were developed to provide comprehensive guidance for acute, sub-acute and persistent PTH
The CR development process included:

- Evidence reviews
- Analysis of the applicability of current clinical practice guidelines
- Input from a multidisciplinary expert panel

Service-specific requirements regarding concussion or the management of PTH may exist

Provider judgment and operational requirements supersede these recommendations when treating patients
Post-traumatic Headache (PTH)

- PTH may occur from injury to the head and also the neck or face
- A PTH diagnosis is largely dependent on the close temporal relationship between injury and headache onset
- PTH is classified as acute (<3 months) or persistent (>3 months) based upon duration of headache
Post-traumatic Headache Risk Factors

- The most common risk factors for the development of PTH include:
  - Premorbid history of headache
  - Female gender
  - Presence of comorbid psychiatric disorders
Research suggests other risk factors include:

- Patient’s expectation of developing a headache after head injury
- Sleep disturbances
- Mood disturbances
- Psychosocial stressors
- Overuse of abortive headache medications
Post-traumatic Headache Types

- Differentiation of headache type is important for optimal treatment. With a thorough history and review of systems, the characteristics of the specific type will emerge.

- The most common types of PTH after concussion are:
  - Migraine
  - Tension type
  - Cervicogenic
  - Headache related to neuropathic pain
General Post-traumatic Headache treatment

- For all types of PTH:
  - Manage headache symptoms
  - Follow both the Concussion Management Algorithm (CMA) and Progressive Return to Activity for Primary Care Manager CR if in the acute phase (recommendation available at dvbic.dcoe.mil)
  - Physical and cognitive rest are important for healing and symptom resolution
  - Avoid benzodiazepines, tramadol, opiates
Post-traumatic Headache Evaluation & Treatment Algorithm

Patient presents with headache after a concussion

Perform focused headache history and assessment

Concussion or headache red flags present?

Yes

Emergent or specialty referral as indicated

No

Review diagnostic criteria and determine headache type

- Migraine
- Tension-Type
- Cervicogenic
- Neuropathic

“Medically Ready Force... Ready Medical Force”
Primary care providers should evaluate whether concussion/mild TBI is a possible cause for any headache.

Remember:

- PTH typically starts within 30 days of head injury
- If prior history of headaches, the TBI could exacerbate headache frequency/severity
- Patients with PTH may not present to the medical provider for treatment until long after the headache starts
Knowledge Check Question 1

Which of the following is a “red flag” and should prompt an immediate evaluation?

a. Any headache even though it is improving
b. Slurred speech
c. Double vision
d. Disorientation
e. All of the above
f. b, c and d only
Knowledge Check Question 1 (cont.)

Which of the following is a “red flag” and should prompt an immediate evaluation?

a. Any headache even though it is improving
b. Slurred speech
c. Double vision
d. Disorientation
e. All of the above
f. b, c, and d only

Answer: **f. b, c, and d only**
Slurred speech, double vision and disorientation are all concussion red flags.
Perform Focused Headache History & Exam

Patient presents with headache after a concussion

Perform focused headache history and assessment

Concussion or headache red flags present?

Yes
Emergent or specialty referral as indicated

No
Review diagnostic criteria and determine headache type

Migraine
Tension-Type
Cervicogenic
Neuropathic

## Focused Headache History

<table>
<thead>
<tr>
<th>Assessment area</th>
<th>Examples of questions and information to collect</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Symptoms</strong></td>
<td>• Persistent pain in head or neck after a concussion (Use of 0-10 scale is recommended, 1= barely present, 5= pain beginning to interfere with activity, and 10= worst imaginable pain)</td>
</tr>
</tbody>
</table>
| **Location**             | • Right or left sided  
• Bilateral vs. unilateral  
• Face  
• Stays in one place or moves around (radiates)  
• Back or on top  
• Forehead  
• Neck                                                                                                                                 |
| **Description of pain**  | • Throbbing/pulsating  
• Pressing/squeezing  
• Stabbing, sharp, or dull/nagging  
• Pain with chewing or opening mouth  
• Head, face or neck tenderness  
• Decreased jaw movement |
| **Frequency and duration**| • Episodic or continuous  
• Seconds, minutes, hours, days or constant                                                                                                                                   |
| **Associated physical symptoms** | • Vision changes (blindness, blurry vision, double vision, eyelid droop, tearing, eye redness or puffiness)  
• Light, noise and odor sensitivity, nose blockage/discharge  
• Nausea, loss of appetite, hunger, bowel changes  
• Premonitory symptoms (fatigue, difficulty concentrating)  
• Neck stiffness or pain  
• Yawning  
• Pallor  
• Auras (visual, sensory or dysphasic speech disturbances)  
• Numbness or tingling around lips, arms or legs |

* Patients on anticoagulant therapy or over the age of 50 have an increased risk of chronic subdural hematoma. This demographic may need imaging with or without specialty referral based on the head trauma history and provider judgment. Refer to the DVBIC CR Neuroimaging Following Mild Traumatic Brain Injury: Guidance in the Non-Deployed Setting that is available at dvbic.dcoe.mil.

</table>

*PCM should consider the possibility of medication overuse headache (MOH) when criteria in Table 5.0 are present. Optimal treatment consists of discontinuation of the offending medications, acute treatment of withdrawal symptoms and pain, and use of analgesic medication as preventative treatment only when necessary.
Migraine Headache

- Most common type of PTH.
- International Classification of Headache Disorders-3 (beta version) provides two major subtypes for migraines:
  - With aura
  - Without aura
- Treatment is the same for both subtypes.
### Table 6.0

**Migraine Headache**

<table>
<thead>
<tr>

<td>ICD-10-CM: G43.109</td>
</tr>
</tbody>
</table>

**Description:**

A. Headache attacks lasting 4-72 hours (untreated or unsuccessfully treated)

B. Headache has at least two of the following characteristics:
   1. Unilateral location
   2. Pulsating quality
   3. Moderate or severe pain intensity
   4. Aggravation by, or causing avoidance of, routine activity (e.g., walking or climbing stairs)

C. During headache at least one of the following:
   1. Nausea and/or vomiting
   2. Photophobia or phonophobia

D. May or may not be accompanied by an aura (present in 15-33 percent of patients). Most common auras are visual, other sensory, motor or speech and language

## Table 7.0 Migraine Headache Pharmacologic Treatment

<table>
<thead>
<tr>
<th>Acute/Abortive Agents</th>
<th>Preventive Treatment</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Mild/moderate:</strong> Acetaminophen; NSAIDs§ (ibuprofen, naproxen, &gt;48 hours following concussion)</td>
<td><strong>First Line:</strong> Tricyclic antidepressants (TCA) (e.g., amitriptyline, nortriptyline); antiepileptics (e.g., topiramate, valproate§§); beta blockers (e.g., metoprolol)</td>
</tr>
<tr>
<td><strong>Severe:</strong> Triptans (e.g., sumatriptan, rizatriptan, zolmitriptan); dihydroergotamine (DHE) nasal spray§§ (pre-treat with antiemetic); Ketorolsac nasal spray§§ or IM</td>
<td><strong>Second Line:</strong> Serotonin norepinephrine reuptake inhibitors (SNRI) (e.g., venlafexine); onabotulinumA§§ (Botox); (referral recommended)</td>
</tr>
</tbody>
</table>

§ Recent U.S. Food and Drug Administration Agency (FDA) warning cautions that NSAIDs can increase the risk of heart attack, heart failure, or stroke in patients with or without pre-existing heart disease, or risk factors for heart disease, even during the first few weeks of treatment, though the risk appears highest with longer use at higher doses. Detailed information on this topic is located at [http://www.fda.gov/Drugs/DrugSafety/ucm451800.htm](http://www.fda.gov/Drugs/DrugSafety/ucm451800.htm)

§§ These medications are not currently available in the deployed formulary; onabotulinumA is FDA approved for treatment of migraine headaches.
Tension-Type Headache Assessment and Diagnosis

- Increased scalp palpation tenderness is the most significant abnormal finding in patients with tension-type headache.
- Tenderness can be elicited by small rotating movements and a firm pressure over the head and neck muscles.
- Tenderness is typically present between headaches.
Table 8.0

</tr>
</tbody>
</table>

## Table 10.0 Tension-Type Headache Pharmacologic Treatment

### Acute/Abortive Agents

**First line:** Acetaminophen; NSAIDs

**Second Line:** Acetaminophen/caffeine compounds

### Preventive Treatment

Selective serotonin reuptake inhibitors (SSRI) (e.g., paroxetine, citalopram);
Serotonin norepinephrine reuptake inhibitors (SNRI) (e.g., venlafaxine);
tricyclic antidepressants (TCA) (e.g., amitriptyline, nortriptyline);
tetracyclic antidepressants (e.g., mirtazapine)

---

§ U.S. Food and Drug Administration Agency (FDA) warning cautions that NSAIDs can increase the risk of heart attack, heart failure, or stroke in patients with or without pre-existing heart disease, or risk factors for heart disease, even during the first few weeks of treatment, though the risk appears highest with longer use at higher doses. Detailed information on this topic is located at [http://www.fda.gov/Drugs/DrugSafety/ucm451800.htm](http://www.fda.gov/Drugs/DrugSafety/ucm451800.htm)
Knowledge Check Question 2

Which of the following interventions is NOT considered a reasonable first-line intervention for acute tension-type headache?

- a. Acetaminophen
- b. Sleep hygiene education
- c. Naproxen
- d. Tramadol
Which of the following interventions is NOT considered a reasonable acute first-line intervention for tension-type headache?

a. Acetaminophen  
b. Sleep hygiene education  
c. Naproxen  
d. Tramadol

Answer: **d. Tramadol**  
Tramadol, benzodiazepines and narcotics should be avoided after TBI.

Headache Related to Neuropathic Pain Diagnosis and Assessment

- Complex chronic pain usually accompanied by soft tissue injury to the scalp or face
- Pain out of proportion to injury
- Burning, tingling type of pain
- Decreased sensation in the affected area
Findings on physical exam include:

- Signs of nerve injury detected during neurologic exam
- Pain may be elicited by palpation of face or scalp, especially over previous laceration or bruise
- May be associated with movement
### Table 13.0 Headache Related to Neuropathic Pain

**Acute/Abortive Agents**

**First Line:** Acetaminophen or NSAIDs

**Second Line:** Antiepileptics (e.g., gabapentin, topiramate); tricyclic antidepressants (TCA) (e.g., amitriptyline, nortriptyline)

**Preventive Treatment**

Antiepileptics (e.g., gabapentin); TCA (e.g., amitriptyline, nortriptyline)

---

U.S. Food and Drug Administration Agency (FDA) warning cautions that NSAIDs can increase the risk of heart attack, heart failure, or stroke in patients with or without pre-existing heart disease, or risk factors for heart disease, even during the first few weeks of treatment, though the risk appears highest with longer use at higher doses.
Medication-Overuse Headache

Characterized as a headache that:

- Is present for 15 or more days/month
- Occurs when medications for the treatment of headaches are used at a higher than recommended dose or for longer than recommended time (i.e., more than three months)

Treatment for Medication-overuse Headache (MOH) is discontinuing the offending medication.

- Use of other medications to manage withdrawal symptoms is controversial
Case Study

- Cpl. Jones is a 22-year-old Marine who sustained a fall 14 days ago in garrison.
- Cpl. Jones lost consciousness for 5 seconds and experienced 15 seconds of post-traumatic amnesia; also, noted immediate headache with pain rating 5/10, nausea and balance problems.
- PMHx: Previous headaches.
Jones sought immediate medical attention, was diagnosed with a concussion and rested for his mandatory 24 hours.

His provider released him to return to pre-injury activity levels 3 days post injury.

It is now 10 days post injury and he presents to sick call today for primary complaint of headaches.
Case Study (cont. 2)

- Jones reports intermittent headaches that last for 5 hours if no medications are taken; headaches are helped a little by ibuprofen
- Headaches are aggravated by physical activity (i.e. PT, recreational sports)
- The character of the headache is throbbing/pulsating; pain is a 5/10 and located on the right side; some nausea with the headaches; denies photophobia or phonophobia with the headaches
Case Study Question 1

All of the following are appropriate steps to take in your follow up evaluation today of CPL Jones EXCEPT:

a. Administer neurobehavioral symptom inventory
b. Palpate head and neck for trigger points or tenderness
c. Order a contrast MRI
d. Complete a neurological examination
All of the following are appropriate steps to take in your follow up evaluation today of CPL Jones EXCEPT:

a. Administer neurobehavioral symptom inventory
b. Palpate head and neck for trigger points/tenderness
c. **Order a contrast MRI**
d. Complete a neurological examination

Answer: *c. **Order a contrast MRI***

Initial case information does not have any red flags necessitating neuroimaging. Complete full work up prior to determining need for the appropriate type of neuroimaging.
Case Study Question 2

Based on the clinical information provided, what type of headache is Cpl. Jones most likely experiencing?

a. Tension-type

b. Migraine

c. Cervicogenic

d. Neuropathic

Case Study Question 3

What is the most appropriate management plate for Jones’ PTH?

a. Provide education on identification and avoidance of headache triggers

b. Review information on environmental stimulus control and sleep hygiene

c. Prescribe NSAID

d. All of the above
What would be the most appropriate management plate for CPL Jones PTH?

a. Provide education on identification and avoidance of headache triggers

b. Review information on environmental stimulus control and sleep hygiene

c. Prescribe NSAID

d. All of the above

Answer: \textit{d. All of the above} are nonpharmacologic and first line pharmacologic treatments to initially address Migraine type PTH.
Summary

- Headache is the most common symptom after a concussion
- The four types of PTH are migraine, tension-type, cervicogenic and headache related to neuropathic pain
- Manage PTH by identifying the headache type it most closely resembles
  - Examples of effective non-pharmacologic treatment include sleep hygiene, physical therapy and relaxation
  - Examples of effective symptomatic pharmacologic treatment include non-narcotic pain medicine and triptans
